

Testing Actor Systems

Principles of Functional Programming

Roland Kuhn

Testing Actors

Tests can only verify externally observable effects.

Testing Actors

Tests can only verify externally observable effects.

```
class Toggle extends Actor {  
  def happy: Receive = {  
    case "How are you?" =>  
      sender() ! "happy"  
      context become sad  
  }  
  def sad: Receive = {  
    case "How are you?" =>  
      sender() ! "sad"  
      context become happy  
  }  
  def receive = happy  
}
```

Akka's TestKit (1)

TestProbe as remote-controlled actor.

```
implicit val system = ActorSystem("TestSys")
val toggle = system.actorOf(Props[Toggle])
val p = TestProbe()
p.send(toggle, "How are you?")
p.expectMsg("happy")
p.send(toggle, "How are you?")
p.expectMsg("sad")
p.send(toggle, "unknown")
p.expectNoMsg(1.second)
system.shutdown()
```

Akka's TestKit (2)

Running a test within a TestProbe:

```
new TestKit(ActorSystem("TestSys")) with ImplicitSender {  
  val toggle = system.actorOf(Props[Toggle])  
  toggle ! "How are you?"  
  expectMsg("happy")  
  toggle ! "How are you?"  
  expectMsg("sad")  
  toggle ! "unknown"  
  expectNoMsg(1.second)  
  system.shutdown()  
}
```

Testing Actors with Dependencies

Accessing the real DB or production web services is not desirable:

- ▶ one simple solution is to add overridable factory methods

Testing Actors with Dependencies

Accessing the real DB or production web services is not desirable:

- ▶ one simple solution is to add overridable factory methods

```
class Receptionist extends Actor {  
  def controllerProps: Props = Props[Controller]  
  ...  
  def receive = {  
    ...  
    val controller = context.actorOf(controllerProps, "controller")  
    ...  
  }  
}
```

Testing Actors with Dependencies

Accessing the real DB or production web services is not desirable:

- ▶ one simple solution is to add overridable factory methods

```
class Getter extends Actor {  
  ...  
  def client: WebClient = AsyncWebClient  
  client get url pipeTo self  
  ...  
}
```

Testing Interaction with the Parent

Create a step-parent:

```
class StepParent(child: Props, probe: ActorRef) extends Actor {  
  context.actorOf(child, "child")  
  def receive = {  
    case msg => probe.tell(msg, sender())  
  }  
}
```

Inserting a Foster-Parent

For when parent-child communication should occur, but monitored:

```
class FosterParent(child: Props, probe: ActorRef) extends Actor {  
  val child = context.actorOf(child, "child")  
  def receive = {  
    case msg if sender() == context.parent =>  
      probe forward msg  
      child forward msg  
    case msg =>  
      probe forward msg  
      context.parent forward msg  
  }  
}
```

Testing Actor Hierarchies

Start verifying leaves, work your way up:
